

Abstract of the Disclosure

Single-piece clips for securing objects to surfaces by insertion through a gap or channel in the surface such as, for example, outdoor decking comprised of spaced-apart planks. The clips include a head, legs and feet properly dimensioned to prevent the clip from being pulled out once positioned. The head provides an aperture to which object fasteners/connectors can be attached, while the legs and feet provide three-dimensional stabilization preventing an object so connected from being displaced.
